Data & Analytics

Capitalize on your business intelligence

Large volumes of data are valuable as they nourish Business Intelligence (BI) and analytics. Central data management systems store, consolidate and pull together critical data across different sources and enable the extraction of useful data by understanding their relationships, interconnections and trends. This leads to advanced analytical information, which helps organizations in making better and faster decisions.

Our **Data Ecosystem Modernization offering** combined with Microsoft Azure Services enables you to overcome issues of complexity, dispersed information and legacy databases to help you get the most of your resources, streamline storage and analytics and accelerate performance.

Uni Systems' Data Platform services are built on Azure and are designed to help you elevate on performance and stability, improve security, utilize new data exploration capabilities, while at the same time establish and assure operational costs and capital expenditures efficiency.

Why modernize data platforms?

Data Platform services will help you

▶ Make faster and better decisions with Industry leading performance, and will produce transformational insights with data integrity.

▶ Increase availability of mission critical intelligent applications, data warehouses and data lakes.

▶ Incorporate advanced security features, which enable you to control unauthorized access of your private data and protect data at rest and data in use.

Our Data Engineers with strong data management experience and a proven track-record are in charge of implementing all aspects of the project. Next generation Data Warehouses coupled with Azure, provide accurate, fast, secure data mining and analytics while interoperate with third party business and IT systems, enabling organizations expand as needed.
